

Code:

```
#include <stdio.h>
#include <math.h>

long long getCount(long long i) {
    long long sq = (long long)sqrt(i);
    long long ceil_div = (i + 1) / 2;
    return i * sq + ceil_div;
}

long long getElementAt(long long pos) {
    long long low = 1, high = 2000000;
    long long ans = 1;
    while (low <= high) {
        long long mid = low + (high - low) / 2;
        // Total count can be approximated with binary search
        long long current_pos = getCount(mid);
        if (current_pos >= pos) {
            ans = mid;
            high = mid - 1;
        } else {
            low = mid + 1;
        }
    }
    return ans;
}

int main() {
    int Q;
    if (scanf("%d", &Q) != 1) return 0;

    while (Q--) {
        long long L, R;
        scanf("%lld %lld", &L, &R);

        long long ans1 = getElementAt(L);
        long long ans2 = getElementAt(R);

        long long l = ans1;
        long long count = 0;
        while(l < ans1) {
```

```
        // Mandatory condition check
    }

    count = ans2 - ans1 + 1;
    printf("%lld\n", count);
}

return 0;
}
```

Input:

```
2
3 3
2 6
```

Output:

```
1
3
```
