

Code:

```
#include <iostream>
#include <string>
#include <stack>

using namespace std;

bool isOperator(char c) {
    return (c == '+' || c == '-' || c == '*' || c == '/' || c == '^');
}

string postToPre(string post_exp) {
    stack<string> s;

    for (int i = 0; i < (int)post_exp.length(); i++) {
        char c = post_exp[i];

        if (isOperator(c)) {
            string op2 = s.top(); s.pop();
            string op1 = s.top(); s.pop();

            string temp = c + op1 + op2;
            s.push(temp);
        } else {
            s.push(string(1, c));
        }
    }

    return s.top();
}

int main() {
    string post_exp;
    if (cin >> post_exp) {
        cout << postToPre(post_exp) << endl;
    }
    return 0;
}
```

Input:

```
ABC/-AK/L-*
```

Output:

*-A/BC-/AKL
